

ABSTRACT

1  
2           A unitary stackable fence module having end assemblies and span  
3 members is provided for forming a perimeter fence having an inwardly inclined  
4 profile. A right angle end support has vertical and horizontal members and an angle  
5 arm, spaced from and attached to a side edge of the vertical and horizontal  
6 members adjacent the span members. The unique arrangement permits a plurality  
7 of fence modules to be stacked for transport or storage. Loops formed on the vertical  
8 members permit pivotal pinning of fence modules together to form perimeter fences  
9 of any polygonal shape.
